

Figure B-1. Empirical and Model-Predicted Tissue Concentrations for Total PCBs. Note: Species on the x-axis are, from left to right, Benthic Invertebrate Filter Feeder (clam); Benthic Invertebrate Consumer (amphipod, oligochaete, insect larvae); Epibenthic Invertebrate Consumer (crayfish); Sculpin; Largescale Sucker; Common Carp; Smallmouth Bass and Northern Pikeminnow.

Commented [BLJ1]: The vertical axis is not accurate in that they haven't plotted the log transform of the concentrations. They have plotted the concentrations on a log-transformed axis. Also, some of the species are not fish. I suggest that the axis title be changed to "Total PCBs tissue concentration ($\mu\text{g/kg ww}$)".
